

## In the real world...

Server configurations change daily, sometimes several times a day.

The server has to be built before data can be restored and the server returned to service.

Operating systems have to be installed and configured not just 'restored from backup'. Installation is the easy part. It is difficult to configure a server without up-to-date configuration data—even for a clairvoyant!

There are utilities that are SUPPOSED to reinstall the operating system. Sometimes they work...Sometimes they don't! There are usually implementation restrictions. They are rarely tested or kept current.

Disk layouts, patches, kernel parameters and other details determine how your server run. It's the details!

## ***Automated System Documentation—The Key to UNIX System Configuration and Recovery***

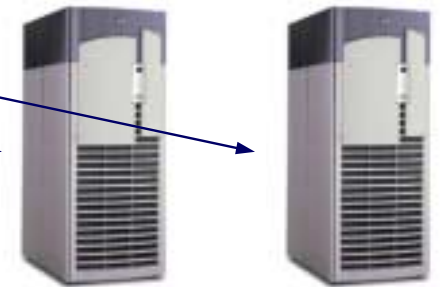

The offsite web server is a replication of the primary administration server. It is automatically updated every few hours with both html and text.

The web server controls data collection, posts configuration reports, converts html copies to text, sends error reports, manages environment .

When directed, servers collect and send configuration data to the web server.

**Tip:** Use the web server to maintain key phone numbers, notes, license keys, etc. at both the operating and recovery site. The offsite web server is automatically updated so the data are protected.

### ***Don't get caught without...***

- ◇ Disk configurations and volume layouts.
- ◇ Device configuration with driver information—including EMC Symmetrix drive information.
- ◇ Operating system patch and kernel parameter information that permit the business software to run.
- ◇ Cluster and high availability configuration specifications.
- ◇ Name service configuration, backup configuration, selected copies of key configuration files.
- ◇ Local Area Network configuration—including LAN card configuration.
- ◇ More....

### ***Key Features...***

- ◇ Fully automatic, updated every day without user or operator intervention.
- ◇ Customized to your environment and servers. If the operating system can read it, you can get it!
- ◇ Virtually maintenance free. Easy to add or remove servers. In html AND text formats!
